(a) the two predicted couplets
Δ-[Θ] ×10⁻⁵ deg cm² dmole⁻¹
Wavelength (nm)
measured (Table S3)
predicted, |μ| = 7.74 D (measured absorption)
predicted, |μ| = 9.40 D (TDDFT)
(b) no neutral-form band: 380-420 nm is flat
normalised absorbance
Wavelength (nm)
dVenus-TD (Fig. 2e)
protonated form would absorb here
380-420 nm mean
−0.06% of the peak
(max +0.3%)
